What the Plastics Engineer Should Know About Patents, Trademarks and Copyrights by Clarence F. Kiech, pg. 37, August

Why is a Plastics Engineer by L. E. Ryan, pg. 129, June

MOLDERS like Durez diallyl phthalates because they handle well with little or no pampering in compression or transfer molding and in preheating. Existing molds can usually be used without modification.

ELECTRICAL ENGINEERS have found in diallyl phthalates a hitherto unavailable solution to problems involving retention of insulation resistance where performance is expected under high humidity and elevated temperature conditions. Dielectric constant and volume and surface resistivity after prolonged conditioning are particularly notable.

MECHANICAL ENGINEERS have found in these Durez materials an end to previous cracking problems, especially where large inserts are involved. Even in service at elevated temperatures, there is little or no after-shrinkage evident over a period of years.

who benefits most ...from DUREZ diallyl phthalates

ALL BENEFIT... from solutions to problems of insulation, dimensional stability, and arc resistance that have bothered manufacturers and molders for years. The Durez line of diallyl phthalate molding compounds provide an exceptional range of electrical properties enhanced by mechanical strength, heat resistance, and dimensional stability. Whichever suits your job best, the uniformity and quality of a Durez material will help you get results that meet your highest expectations. Send for data and a trial shipment of any or all of these:

DUREZ 16694 GREEN AND 18276 BLUE. Orlon-filled. Both are outstanding insulators. Negligible lifetime shrinkage. No after-bake required

DUREZ 18783. Glass-filled. Impact strength, 15 ft. lb./in. Notable for dielectric properties, heat resistance. Suitable for highly intricate molding jobs.
